HOW AI WORKS

The AI Loop

A simple model of AI that learns from examples. Met in Year 1, used every year.

1

Learn

It looks at lots of examples that people choose.

2

Spot

It finds the pattern.

3

Guess

It uses the pattern to guess: a label, a next word, a video, a picture.

4

Check

A person checks the guess. It can be wrong without knowing.

People check before they trust it.

How the idea grows

Learn: Year 1: it learns from lots of examples. Year 5: training data, test data, permission and fairness.

Spot: Year 1: spotting a secret sorting rule. Year 4: patterns in words. Year 5: rules versus learning.

Guess: Year 1: it makes a guess. Year 4: next word prediction and how sure it is. Year 6: generated images, text and voices.

Check: Every year: people check its guesses, from "is it right?" in Year 1 to "who is missing?" in Year 6. That is where IDEAL comes in.
